

Purpose: Build a custom CRM + technician mobile application for a cleaning business, with scalable architecture to support future SaaS expansion.

ABOUT THE PROJECT

I am building a modern, all-in-one CRM and technician mobile app for the cleaning industry. The system will manage scheduling, routing, pricing, communication, client data, technician tracking, and daily operations. Long-term, this platform will be sold as a SaaS product to other cleaning companies, so it must be scalable, secure, and multi-tenant ready.

This is not a simple website — it is a full operational system with GPS, routing, automation, and mobile functionality.

LONG-TERM RELATIONSHIP

This starts at a competitive rate, but the real value is the long-term upside. I want someone who believes in what we're building and wants to grow with it, not someone looking for a quick paycheck. As the platform scales, your role, your impact, and your compensation will grow with it. I'm building this for the long term, and I want the right person to build it with me.

WHAT I'M LOOKING FOR IN A DEVELOPER

I am looking for a **skilled full-stack developer or development team** with experience in:

✓ Backend Development

- PostgreSQL (required)
- **PostGIS** (required for geolocation, routing, distance calculations)
- Node.js, Django, or FastAPI (API layer)
- REST API design

✓ Mobile App Development

- Flutter (preferred) or React Native
- Experience building iOS and Android apps

- Offline mode & background GPS tracking

✓ **Frontend Development**

- React (preferred) or Angular
- Admin dashboard interfaces

✓ **Geolocation & Mapping**

- Google Maps API or Mapbox
- Distance Matrix
- Directions
- Nearest technician logic

✓ **Cloud & Infrastructure**

- AWS or DigitalOcean
- S3 bucket storage
- GitHub version control
- Secure authentication

✓ **Communication Integrations**

- Twilio (SMS)
- SendGrid or Mailgun (Email)

✓ **A Payment Integration Module (PIM)**

This module allows:

- Collecting payments

- Saving cards on file (if processor supports it)
- Auto-charging on recurring cleanings
- Handling refunds
- Viewing payment history
- Sending payment links
- Using payment APIs from different providers

Each processor will plug into the same internal PIM, so adding a new provider is simple.

CRM to have an **open payment integration layer**, meaning:

- ✓ **Software can connect to multiple payment processors**
- ✓ **Users can choose which processor they want**
- ✓ **Future processors can be added easily**

HIGH-LEVEL SYSTEM REQUIREMENTS

1. Technician Mobile App

The app must allow technicians to:

- View assigned schedule
- See job details
- View notes, access instructions, parking info
- Check in/out
- Track drive time (optional)
- Upload before/after photos
- Complete checklists

- Receive push/SMS notifications
- Sync offline work when connected
- Share real-time GPS location every 10–30 seconds

2. Admin CRM Dashboard

The admin system must include:

- Client & property database
- Job creation customization to user needs and form of pricing.
- Technician assignment
- Calendar view (drag & drop scheduling)
- Map view of technician locations
- Job history with photos & notes
- Automated SMS/email reminders
- Estimates and pricing calculator
- Recurring job templates
- Reporting (basic at first)
 - Weekly, Monthly , Custom Dates Sales

3. Smart Scheduling Engine

Scheduling must account for:

✓ Technician availability

- Workdays
- Start/end of shift
- Time off

✓ Technician capacity

- Full-time vs Part-time
- **Maximum weekly hours** allowed
- Hours already assigned this week

✓ **Technician proximity**

- GPS location
- Distance to job
- ETA (travel time, not just distance)
- Previous job location

✓ **Job requirements**

- Job duration (from calculator)
- Required team size (future phase)

The system must **automatically filter out** technicians who exceed their max weekly hours.

4. Pricing Calculator

Calculator must generate pricing and expected job duration using:

- Square footage
- Bedrooms
- Bathrooms
- Stories
- Dirt level
- Add-ons
- Frequency

Optional future: auto-fetch home size from Zillow API.

5. Automations

System must send:

- Appointment reminders
- Technician on-the-way notifications
- Completion messages
- Estimate follow-ups

6. SaaS Ready

The system must be structured to support:

- Multiple companies
- Separate data for each business
- Subscription billing (future)

DEVELOPMENT EXPECTATIONS

✓ Milestone-based work

Each phase must be delivered fully before moving to the next.

✓ Code ownership

All code and IP belong to me.

Developer works under a Work-for-Hire agreement.

✓ GitHub access

You work inside my private repository.

I own the infrastructure (AWS, Maps, Twilio).

✓ Weekly updates

Short demos or progress videos every 7 days.

✓ **Clear documentation**

Database schema, API documentation, and deployment notes.

WHAT SUCCESS LOOKS LIKE

- MVP working in my cleaning business within 8–12 weeks
- Smart scheduling + routing within 4–7 months
- SaaS-ready platform within 12–18 months
- Clean, documented, stable code that can scale
- A trusted relationship for ongoing feature development
